Chadwriter: Writing for Chads (in Loric)

Just type Loric romanization (both the plain ASCII style (bb) and the fancy Unicode style (b) are supported) into the input box, and Loric glyphs for that text will appear below. G maps to K and D to T, as those distinctions are not found in written Loric. C represents the extremely rare optional explicit “null vowel” letter. ’ is the character you have to put after a consonant to indicate its vowel was implicit, and if followed by another of the same letter, should not be interpreted as geminate. \_ is reserved for internal use, and is forbidden to occur in your input texts. In cursive mode, if you type an invalid sequence of vowels and consonants, this will result in an invalid input indicator. Compositional straightive, and decompositional cursive, (two later & eccentric innovations of Loric printing presses) remain unimplemented here. Stacked dashes are unimplemented, but the rest of the punctuation is implemented—with fairly arbitrary ascii characters for many of them. Not all of the conventions of this project would seem idiomatic to a Loric speaker. If you don’t have lettermapping.css in this directory, run ./make-css-classes > lettermapping.css in this directory to generate it.

Writing style: cursive straightive unlinated straightive
